# Midterm Result

Yiying Wu (yw3996)

# Exploratory analysis and data visualization

In this section, use appropriate visualization techniques to explore the dataset and identify any patterns or relationships in the data.

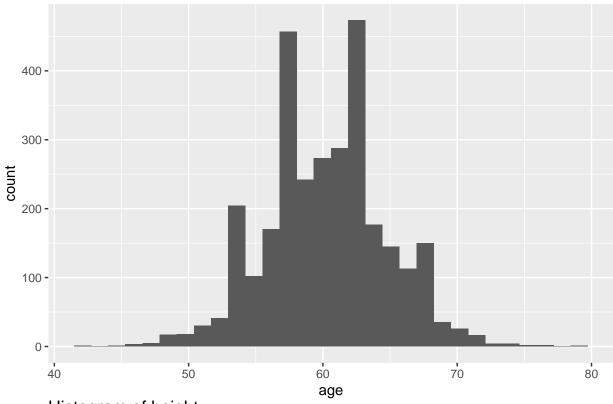

### **Summary statistics**

Table 1: Summary of Dataset

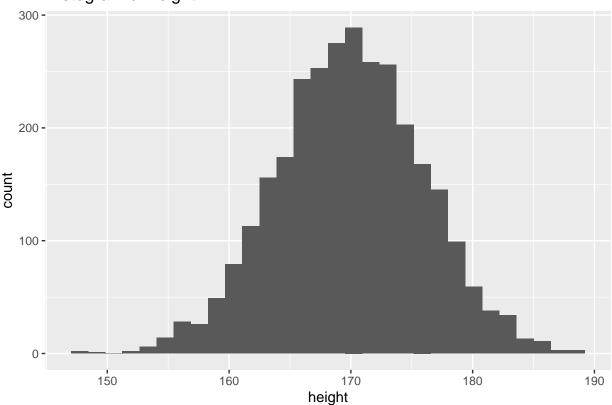

Characteristic	$N=3,\!000^{1}$
age	60.0 (57.0, 63.0)
${f gender}$	
male	1,544 (51%)
female	1,456 (49%)
race	
White	1,967~(66%)
Asian	$158 \ (5.3\%)$
Black	604 (20%)
Hispanic	271 (9.0%)
$\mathbf{smoking}$	
Never smoked	1,822 (61%)
Former smoker	859 (29%)
Current smoker	319 (11%)
height	169.9 (166.0, 173.9)
weight	80 (75, 85)
bmi	$27.65\ (25.80,\ 29.50)$
hypertension	1,492 (50%)
diabetes	463 (15%)
$\operatorname{SBP}$	$130\ (125,\ 136)$
$\mathrm{LDL}$	110 (97, 124)
vaccine	
Not vaccinated	1,212 (40%)
Vaccinated	$1,788 \ (60\%)$
severity	
Not severe	2,679 (89%)
Severe	$321 \ (11\%)$
$\operatorname{study}$	
$\mathbf{A}$	2,000~(67%)
В	1,000 (33%)
${\bf recovery\_time}$	39 (31, 49)

 $<sup>^{1}\</sup>mathrm{Median}$  (IQR); n (%)

## Model training

In this section, describe the models you used to predict the time to recovery from COVID-19. Briefly state the assumptions made by using the models. Provide a detailed description of the model training procedure and how you obtained the final model.

Outcome: recovery\_time

#### Data preparation

```
dat <- subset(dat, select = -id)
dat$study <- ifelse(dat$study == "A", 0, 1)
dat <- dat %>%
  mutate(
    gender = as.factor(gender),
    race = as.factor(race),
    smoking = as.factor(smoking),
    hypertension = as.factor(hypertension),
    diabetes = as.factor(diabetes),
    vaccine = as.factor(vaccine),
    severity = as.factor(severity),
    study = as.factor(study)
)
```

Partition the dataset into two parts: training data (80%) and test data (20%).

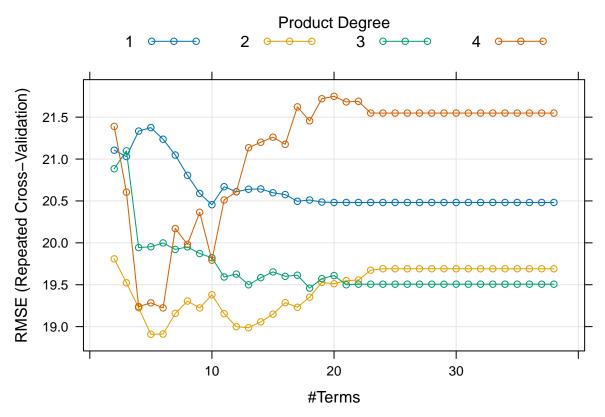

```
set.seed(666)
data_split <- initial_split(dat, prop = 0.8)

# Extract the training and test data
training_data <- training(data_split)
x_train <- model.matrix(recovery_time ~ ., training_data) [ ,-1]
y_train <- training_data$recovery_time

testing_data <- testing(data_split)
x_test <- model.matrix(recovery_time ~ ., testing_data) [ ,-1]
y_test <- testing_data$recovery_time

# ctrl
ctrl <- trainControl(method = "repeatedcv", number = 10)</pre>
```

Multivariate Adaptive Regression Spline (MARS) Model

```
# both number of terms and product degree are upper bounds
# best tune
model.mars$bestTune
```

## nprune degree ## 41 5 2

#### coef(model.mars\$finalModel)

```
## (Intercept) h(31-bmi)
## -3.1983530 6.3999877
## h(bmi-31) * study1 h(bmi-25.2)
## 25.6820131 7.9260754
## h(weight-86.4) * h(bmi-31)
## -0.6277843
```

### $\mathbf{test}\ \mathbf{error}$

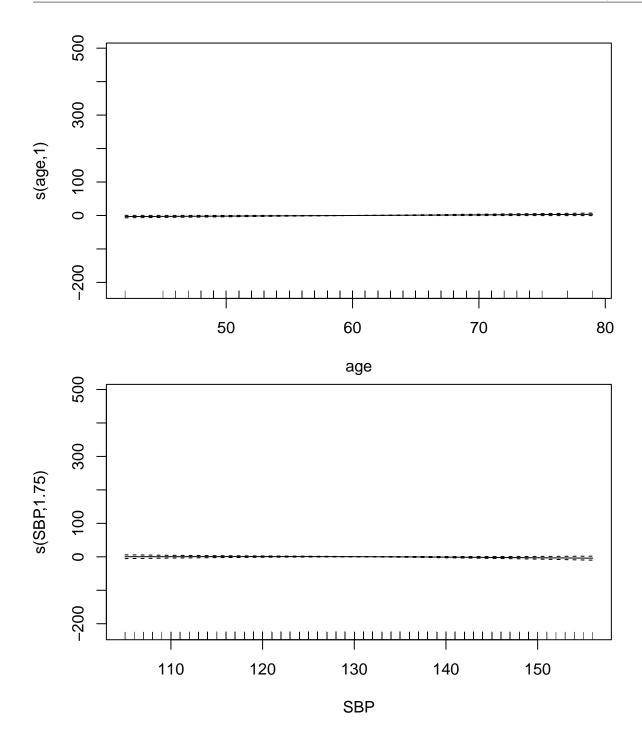

```
mars.pred <- predict(model.mars, newdata = x_test)
test_error_mars <- mean((mars.pred - y_test)^2)
test_error_mars</pre>
```

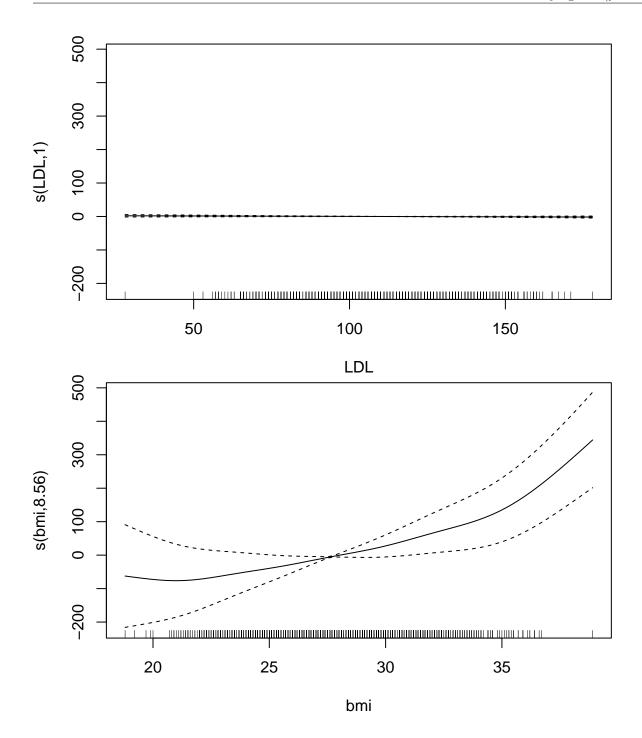

## [1] 279.0367

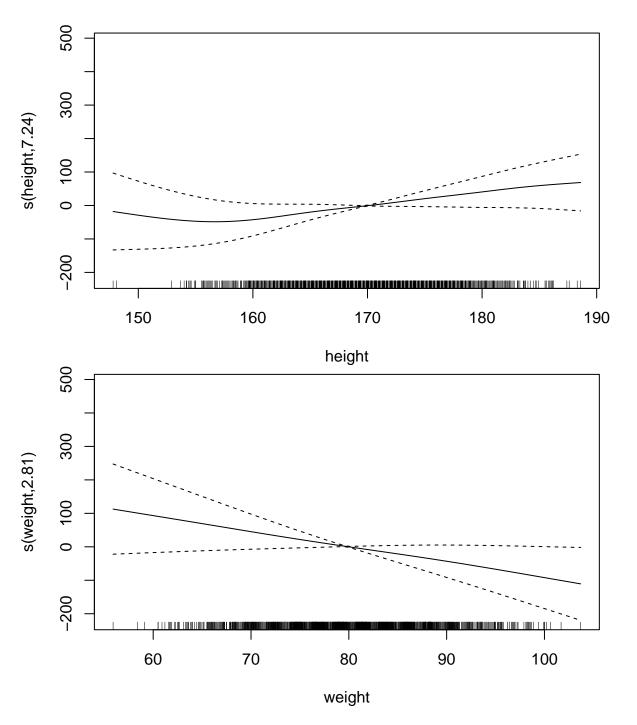

# Plotting

plot(model.gam\$finalModel)

```
RMSE_mars <- sqrt(test_error_mars)</pre>
RMSE_mars
## [1] 16.70439
The MSE of MARS model is 279.037.
Generalized Additive Model (GAM)
set.seed(666)
model.gam <- train(x = x_train,</pre>
                   y = y_train,
                   method = "gam",
                   tuneGrid = data.frame(method = "GCV.Cp", select = c(TRUE, FALSE)),
                   trControl = ctrl)
model.gam$bestTune
     select method
## 1 FALSE GCV.Cp
model.gam$finalModel
##
## Family: gaussian
## Link function: identity
##
## Formula:
## .outcome ~ gender1 + race2 + race3 + race4 + smoking1 + smoking2 +
       hypertension1 + diabetes1 + vaccine1 + severity1 + study1 +
##
       s(age) + s(SBP) + s(LDL) + s(bmi) + s(height) + s(weight)
## Estimated degrees of freedom:
## 1.00 1.75 1.00 8.56 7.24 2.81 total = 34.36
## GCV score: 384.8296
# degree of freedom=1 means linear
```

```
# compute and report the test error
predictions <- predict(model.gam, x_test)
test_error <- mean((predictions - y_test)^2) # Mean Squared Error (MSE)
test_error # Reporting the test error</pre>
```

## [1] 272.0012

The MSE of GAM model is 272.001

#### lasso model

Here's the selected tuning parameter when the minimal MSE rule is applied

#### lasso.fit\$bestTune

```
## alpha lambda
## 68 1 0.00912288
```

The best tuning parameter is 0.009

And the test error is

```
lasso.pred <- predict(lasso.fit, newdata = testing_data)
# test error
mean((lasso.pred - testing_data$recovery_time)^2)</pre>
```

```
## [1] 298.3016
```

The MSE of lasso model is 298.302

#### Elastic net model

Here's the selected tuning parameter

### enet.fit\$bestTune

```
## alpha lambda
## 365 0.15 0.00367552
```

The best tuning parameter is 0.004

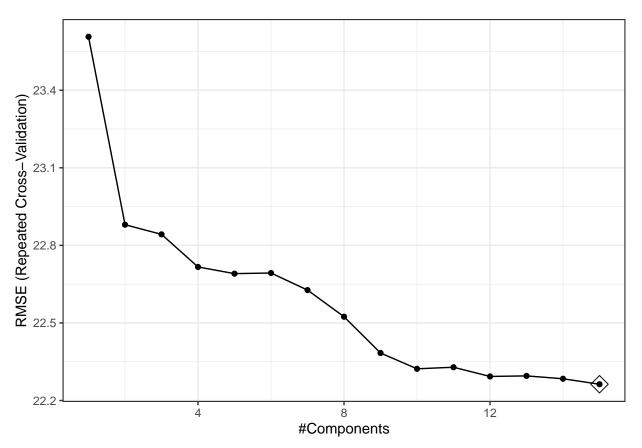

And the test error is

```
enet.pred <- predict(enet.fit, newdata = testing_data)
# test error
mean((enet.pred - testing_data$recovery_time)^2)</pre>
```

## [1] 297.1642

The MSE of elastic net model is 297.164

### Principal components regression (PCR)

```
# test MSE
mean((y_test - predy.pcr)^2)
## [1] 323.779
```

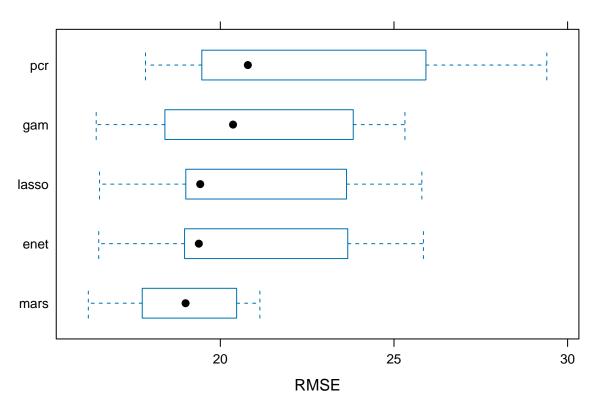

## **Model Comparison**

The MSE of pcr model is 323.779

compare the RMSE

```

## pcr
```

```
bwplot(resamp, metric = "RMSE")
```

The MARS model is preferred since it has a lower mean value of RMSE compared to other models.
